Tyrosine kinase (TK) inhibitors are a new class of anticancer drugs that have recently been developed. The target is cellular growth pathways that involve the binding of a growth factor to its receptor-TK complex and the subsequent downstream events that result in cell proliferation and apoptosis. Thus, these compounds have been used to block the growth of human tumors that involve such growth factor receptors as the insulin-like growth factor-1 receptor and the epidermal growth factor a1d647c40b
